1. Introduction

1. Introduction

Premise of this paper

Can a neural network be trained to deduce withheld ciphers from unaligned text, without the supplementation of preexisting human knowledge?

Historical context

- Decryption was human-guided

Unsupervised learning

- Unpaired bank of ciphertext/plaintext
- No knowledge of vocab frequencies or cipher keys
- Large vocab (200 elements)

2. Key Concepts

2.1 Caesar Shift

PLAIN: a b c d e f g h i j k l m n o p q r s t u v w x y z

3-SHIFTED: d e f g h i j k l m n o p q r s t u v w x y z a b c

Example: hello world → khoor zruog

2.1 Caesar Shift

PLAIN: a b c d e f g h i j k l m n o p q r s t u v w x y z

3-SHIFTED: d e f g h i j k l m n o p q r s t u v w x y z a b c

Example: hello world → khoor zruog

Weakness

- Trivial to solve with frequency analysis

2.3 Generative Adversarial Networks

Generator

- Attempts to produce convincing samples from data distribution
- Denoted as F

Discriminator

- Tries to distinguish between true and synthetic samples
- Denoted as G

$$D^* = \arg \max_D E_{x \sim \mathcal{X}} [\log D(x)] - E_{z \sim \mathcal{Z}} [\log(1 - D(F(z)))]$$

2.3 Generative Adversarial Networks

$$D^* = \arg \max_D E_{x \sim \mathcal{X}} [\log D(x)] - E_{z \sim \mathcal{Z}} [\log(1 - D(F(z)))]$$

D^*

- optimal discriminator

$\arg \max_D$

- parameters causing highest possible score

$E_{x \sim \mathcal{X}}$

- Real data

$D(x)$

- Assigned probability
- (e.g. 1 = real, 0 = fake)

$F(z)$

- Generator creating fake text

$1 - D(F(z))$

- Chance of correctly identifying fakes

2.3 Generative Adversarial Networks

$$D^* = \arg \max_D E_{x \sim \mathcal{X}} [\log D(x)] - E_{z \sim \mathcal{Z}} [\log(1 - D(F(z)))]$$

D^*

- optimal discriminator

$\arg \max_D$

- parameters causing highest possible score

$E_{x \sim \mathcal{X}}$

- Real data

$D(x)$

- Assigned probability
- (e.g. 1 = real, 0 = fake)

$F(z)$

- Generator creating fake text

$1 - D(F(z))$

- Chance of correctly identifying fakes

Vulnerable to mode collapse

- Generator loses diversity - distribution collapses

2.3 Generative Adversarial Networks

Figure 2: Discriminators trained on the toy example of recognizing the bottom-right corner of a simplex as true data. From left to right the discriminators were regularized using: nothing; WGAN Jacobian norm regularization; and, the relaxed sampling technique.

Original GAN can be too strict

- No helpful feedback

Used by this paper

- Wasserstein Jacobian norm
- Relaxation Sampling

3. Related Work

3.1 CycleGAN

Two distributions

- \mathcal{X} & \mathcal{Y}

Two generators

- $F : \mathcal{X} \rightarrow \mathcal{Y}$
- $G : \mathcal{Y} \rightarrow \mathcal{X}$

Two discriminators

- $D_{\mathcal{X}} : \mathcal{X} \rightarrow [0, 1]$
- $D_{\mathcal{Y}} : \mathcal{Y} \rightarrow [0, 1]$

Cycle loss

- L1 Norm - original text vs. round-trip text
- Forces model to be one-to-one

$$\mathcal{L}_{\text{cyc}}(F, G, \mathcal{X}, \mathcal{Y}) =$$

$$E_{x \sim X}[\|G(F(x)) - x\|_1] + E_{y \sim Y}[\|F(G(y)) - y\|_1]$$

3.1 CycleGAN

Consider the losses together

$$\mathcal{L}(F, G, D_y, D_x, \mathcal{X}, \mathcal{Y}) = \underbrace{\mathcal{L}_{\text{GAN}}(F, D_y, \mathcal{X}, \mathcal{Y})}_{\text{forward pass}} + \underbrace{L_{\text{GAN}}(G, D_x, \mathcal{Y}, \mathcal{X})}_{\text{backward pass}} + \lambda * \mathcal{L}_{\text{cyc}}(F, G, \mathcal{X}, \mathcal{Y})$$

Forward pass

- Generator F: Plaintext to ciphertext for discriminator D_y

Backward pass

- Generator G: Ciphertext to plaintext for discriminator D_x

λ

- Hyperparameter for weight of cycle

Cycle

- Ensures diversity
- Avoid mode collapse
